'Otocoup' & '3Dcoup' router wiring and cabling.
For licensing conditions, see main router drawings.

Using domestic current present mortal danger, so it is an absolute requirement that you have knowledges in electricity and you well understand what you are doing.

If you have not a perfect understanding of the attached diagrams, don't even think to realise the power part.

And once again, you are doing that under your own responsability.

I've make my best to have the schematic compliant with the 'Machines' European directive, say to have the emergency shutdown operate in a fail safe manner, but i don't guaranty anything.
